

Fuel Eco Tech

WHAT IS FET?

Fuel Eco Tech is an innovative system that improves the efficiency of fuel combustion in diesel and gasoline engines.

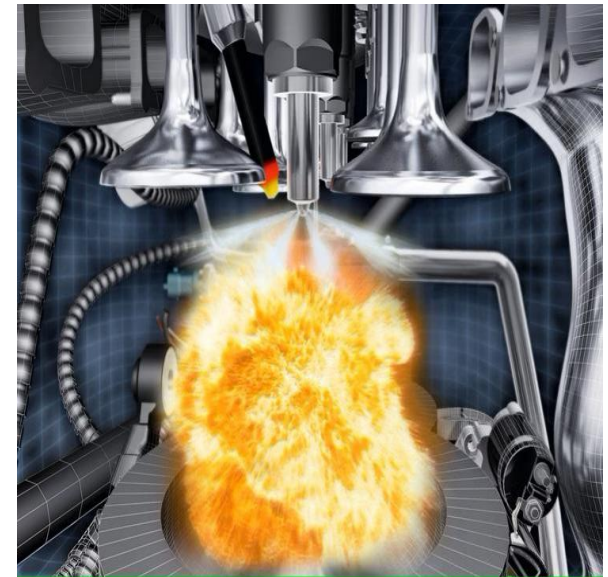

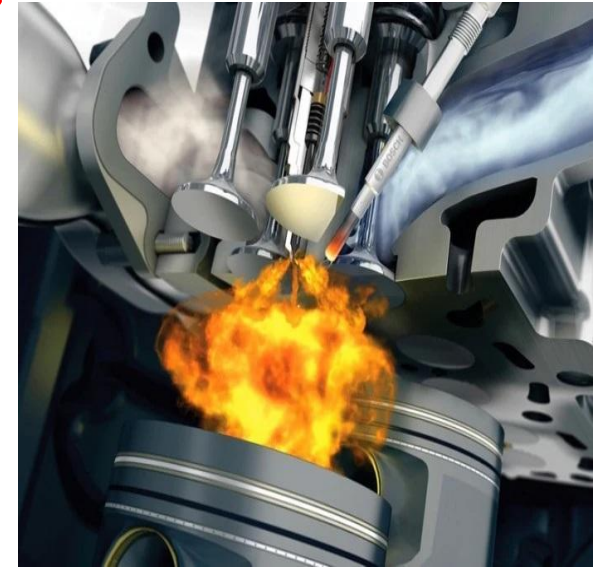

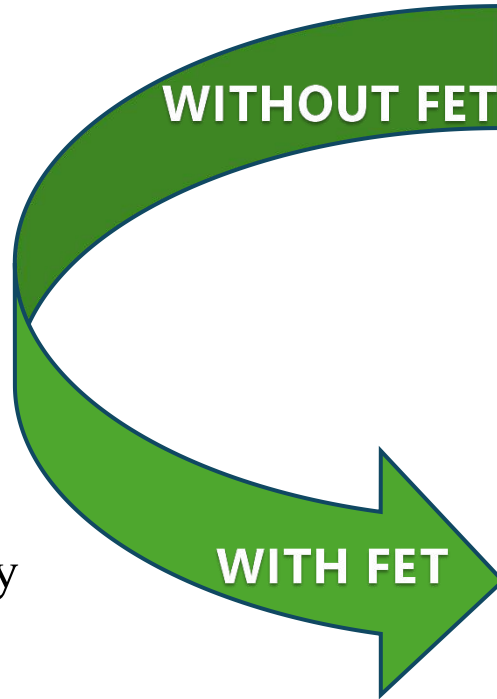

HOW?

The system improves the distribution and turbulence of the air-fuel mixture in the combustion chamber.

This allows oxygen to be used more effectively, resulting in more complete and cleaner combustion.

FUNCTION

- **Improved oxygen utilization:** The oxygen in the air-fuel mixture is better utilized.
- **Patented swirl chamber system:** The swirl causes the oxygen to be more fully integrated into the combustion process, resulting in more efficient combustion.

EFFECT/BENEFIT

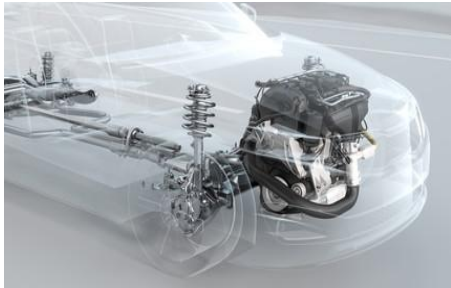

- **Reduced emissions**

More complete combustion means fewer harmful exhaust gases such as CO₂, nitrogen oxides (NO_x) and soot particles, thus making environmental impact cleaner and easier to track.

- **Reduced fuel consumption**

Through improved combustion, the fuel is used more efficiently because Less unburned fuel is produced, which lowers consumption.

- **Engine performance is increased**

The more effective conversion of energy from the fuel ensures a moderate increase in performance without putting more strain on the engine.

- **.Extends the service life of engine components:** Fewer residues from incomplete combustion mean less wear and fewer deposits in the engine, resulting in a longer service life.

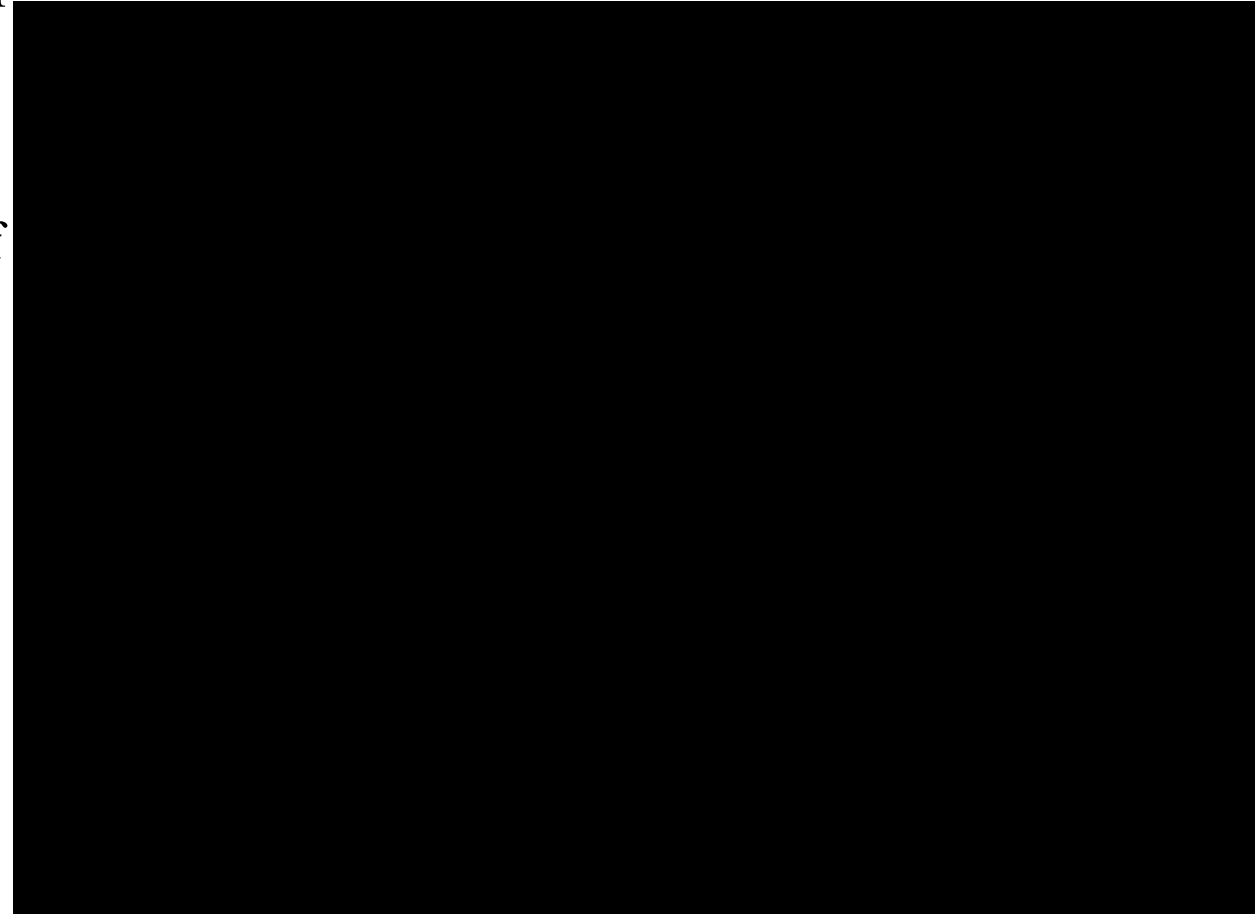

INSTALLATION LOCATION AND SETUP

The FET is integrated into the fuel line, between the high-pressure fuel pump and the fuel filter.

NOTE:

- It works exclusively on the preparation and swirling of the fuel, without directly intervening in the combustion engine, the control electronics or the exhaust gas aftertreatment
- The installation is carried out outside of the high-pressure fuel system, which means that no changes to the injection system or engine components are necessary
- The system does not change the chemical composition of the fuel or the way the engine works
- It is a physical optimization that improves combustion efficiency without mechanical or electronic intervention in the factory systems.

USERS

The EFT system can be used in a wide range of vehicles powered by diesel or gasoline, such as;

- **Cars**

For frequent drivers who want to reduce operating costs while lowering their CO₂ footprint.

- **Trucks & Vans**

More profitability in fleet operations: lower consumption, lower emissions, reduced maintenance costs.

- **Agriculture**

Reduces diesel consumption in tractors & harvesting machines, protects the engine and sustainably improves efficiency.

- **Construction Machinery**

Lowers consumption and saves operating costs long-term – ideal under heavy load and long operating hours.

USERS

- **Public Transport**

Helps cities reduce operating costs and CO₂ emissions – especially with predictable, recurring driving profiles.

- **Marine**

Optimizes fuel consumption and improves profitability – in commercial and private use.

- Efficiency that matters in daily operations
- FET system means one thing to us: clear results, traceable context and clean implementation. That is why we combine lab tests, field reports and customer feedback into one consistent story – for serious market communication.
